

Sinimuna UX Design

PC Buy Application for the Air Force

April - May, 2005

Visual Use Case Air Force PC Buy Web Application Development

Building an Order

A Visual Use Case is a visual representation of the user interface necessary to realize a given use-case. The goal is to establish the behavior and external functionality of the software within key use-cases by depicting content elements, regions and potential content organization or grouping of interface elements. These can be used effectively to visually present requirements to clients and team members, and to confirm or refine those requirements.

A Visual Use Case does not represent the graphic design (look and feel) which the final application will exhibit, nor literally depict actual placement of elements on individual pages.

A Visual Use Case (VUC):

- Is used during requirements gathering and initial design of the system to elicit client/user feedback, and to help stabilize requirements as early as possible
- Describes visually, in words and pictures, how the system responds to user actions
- Is linked to a use case or multiple use cases
- Provides an external view of system functionality:
 - a. Narrative in nature
 - b. Conceptualizes interaction between user and system
 - c. Illustrates meaningful use of the system
- Documents user flow through a portion of the application
- Includes commentary around user and system behavior
- Facilitates clearer communication within the project team, which may be the most valuable aspect of this tool.
